Question 6

Consider the differential equation $\frac{dy}{dx} = (3 - y)\cos x$. Let y = f(x) be the particular solution to the differential equation with the initial condition f(0) = 1. The function f is defined for all real numbers.

- (a) A portion of the slope field of the differential equation is given below. Sketch the solution curve through the point (0, 1).
- (b) Write an equation for the line tangent to the solution curve in part (a) at the point (0, 1). Use the equation to approximate f(0.2).
- (c) Find y = f(x), the particular solution to the differential equation with the initial condition f(0) = 1.

1: solution curve

(b) $\frac{dy}{dx}\Big|_{(x, y)=(0, 1)} = 2\cos 0 = 2$ An equation for the tangent line is y = 2x + 1. $f(0.2) \approx 2(0.2) + 1 = 1.4$

 $2: \left\{ \begin{array}{l} 1: tangent \ line \ equation \\ 1: approximation \end{array} \right.$

(c) $\frac{dy}{dx} = (3 - y)\cos x$ $\int \frac{dy}{3 - y} = \int \cos x \, dx$ $-\ln|3 - y| = \sin x + C$ $-\ln 2 = \sin 0 + C \Rightarrow C = -\ln 2$ $-\ln|3 - y| = \sin x - \ln 2$ Because y(0) = 1, y < 3, so |3 - y| = 3 - y $3 - y = 2e^{-\sin x}$ $y = 3 - 2e^{-\sin x}$ Note: this solution is valid for all real numbers.

 $6: \left\{ \begin{array}{l} 1: \text{ separation of variables} \\ 2: \text{ antiderivatives} \\ 1: \text{ constant of integration} \\ 1: \text{ uses initial condition} \\ 1: \text{ solves for } y \end{array} \right.$

Note: max 3/6 [1-2-0-0-0] if no constant of integration

Note: 0/6 if no separation of variables
